- a) We cut a lot of wood for the fire.
- b) Roy knocked at the door of the office.
- c) After school John cycle to the park and plays cricket.
- d) Carol ate four sweets and gave the rest away.

**Q3. Comprehension.**

We can watch things around us move. When something is in motion, it changes its position. Objects can move from one place to another. They can move in many directions. If you roll a ball, it might move in a straight line. It might also move in a curve. A swing can move back and forth. A light switch can move up and down. Fans have blades that move in a circle. If you want to know if something is moving, you can compare it to other things around it that are not moving. If the things behind the object are changing, the object is probably moving. If they are not changing, the object is probably not moving.

You can measure the motion of an object. Just measure the distance between where it was when it started to move and where it was when it stopped. Distance can be measured in inches, feet, yards or miles. Those measurements are in the customary system. It can also be measured in millimeters, centimeters, meters and kilometers. Those measurements are in the metric system. Answer the following questions based on the reading passage. Don't forget to go back to the passage whenever necessary to find or confirm your answers.

- a) When something is in motion, what does it change?
- b) How does a swing move?
- c) How does a light switch move?
- d) How can you test if something is moving or not?
- e) What is one unit of measurement you could use to measure distance?
